

APPENDICES TO
KLAMATH RIVER NUTRIENT LOADING AND RETENTION
DYNAMICS IN FREE-FLOWING REACHES, 2005-2008

PREPARED FOR THE
YUROK TRIBE ENVIRONMENTAL PROGRAM

BY

**ELI ASARIAN
KIER ASSOCIATES
EUREKA, CALIFORNIA**

**JACOB KANN, PH.D.
AQUATIC ECOSYSTEM SCIENCES LLC
ASHLAND, OREGON**

**WILLIAM W. WALKER, PH.D.
ENVIRONMENTAL ENGINEER
CONCORD, MASSACHUSETTS**

Citation:

Asarian, E. J. Kann, and W. Walker. 2010. Klamath River Nutrient Loading and Retention Dynamics in Free-Flowing Reaches, 2005-2008. Final Technical Report to the Yurok Tribe Environmental Program, Klamath, CA. 59pp + appendices.

APPENDICES

A1. Coefficients from multiple regression model

A2. Comparison of results of five methods for calculating nutrient loads

A3. Table with complete seasonal summaries of budget components for all parameters and reaches

A4. Scatterplots showing the relationship between reach inflow nutrient concentration and retention for June-October periods

A5. Charts showing daily time series and summaries of outputs from multiple regression model used to predict concentrations for each station

APPENDIX A1

Coefficients from multiple regression model used to calculate daily loads

Table A1. Standard error, coefficient of determination (R^2) and regression coefficients for each station for total phosphorus. See methods section for predictive equation and explanation of regression coefficients.

APPENDIX A2

Comparison of results of five methods for calculating nutrient loads

Table A2. Comparison of mean daily loads at mainstem and major tributary stations calculated using five algorithms as described below. Mean daily loads were calculated only from sites/years/parameters when sampling frequency was adequate (i.e. monthly or better, see section 3.5.2.1 Seasonal Summaries for Primary Reaches in report for more details); thus, the number of years included in the mean daily load values vary by site and parameter (range is between one and four years). Standard error and regression R² are for method 5 only).

Site	Parameter	Relative Std Error	Regression R2	Mean Daily Load (MT/day)					M3 Load as % of M5 Load

APPENDIX A4

Scatterplots showing the relationship between reach inflow nutrient concentration and retention for June-October periods

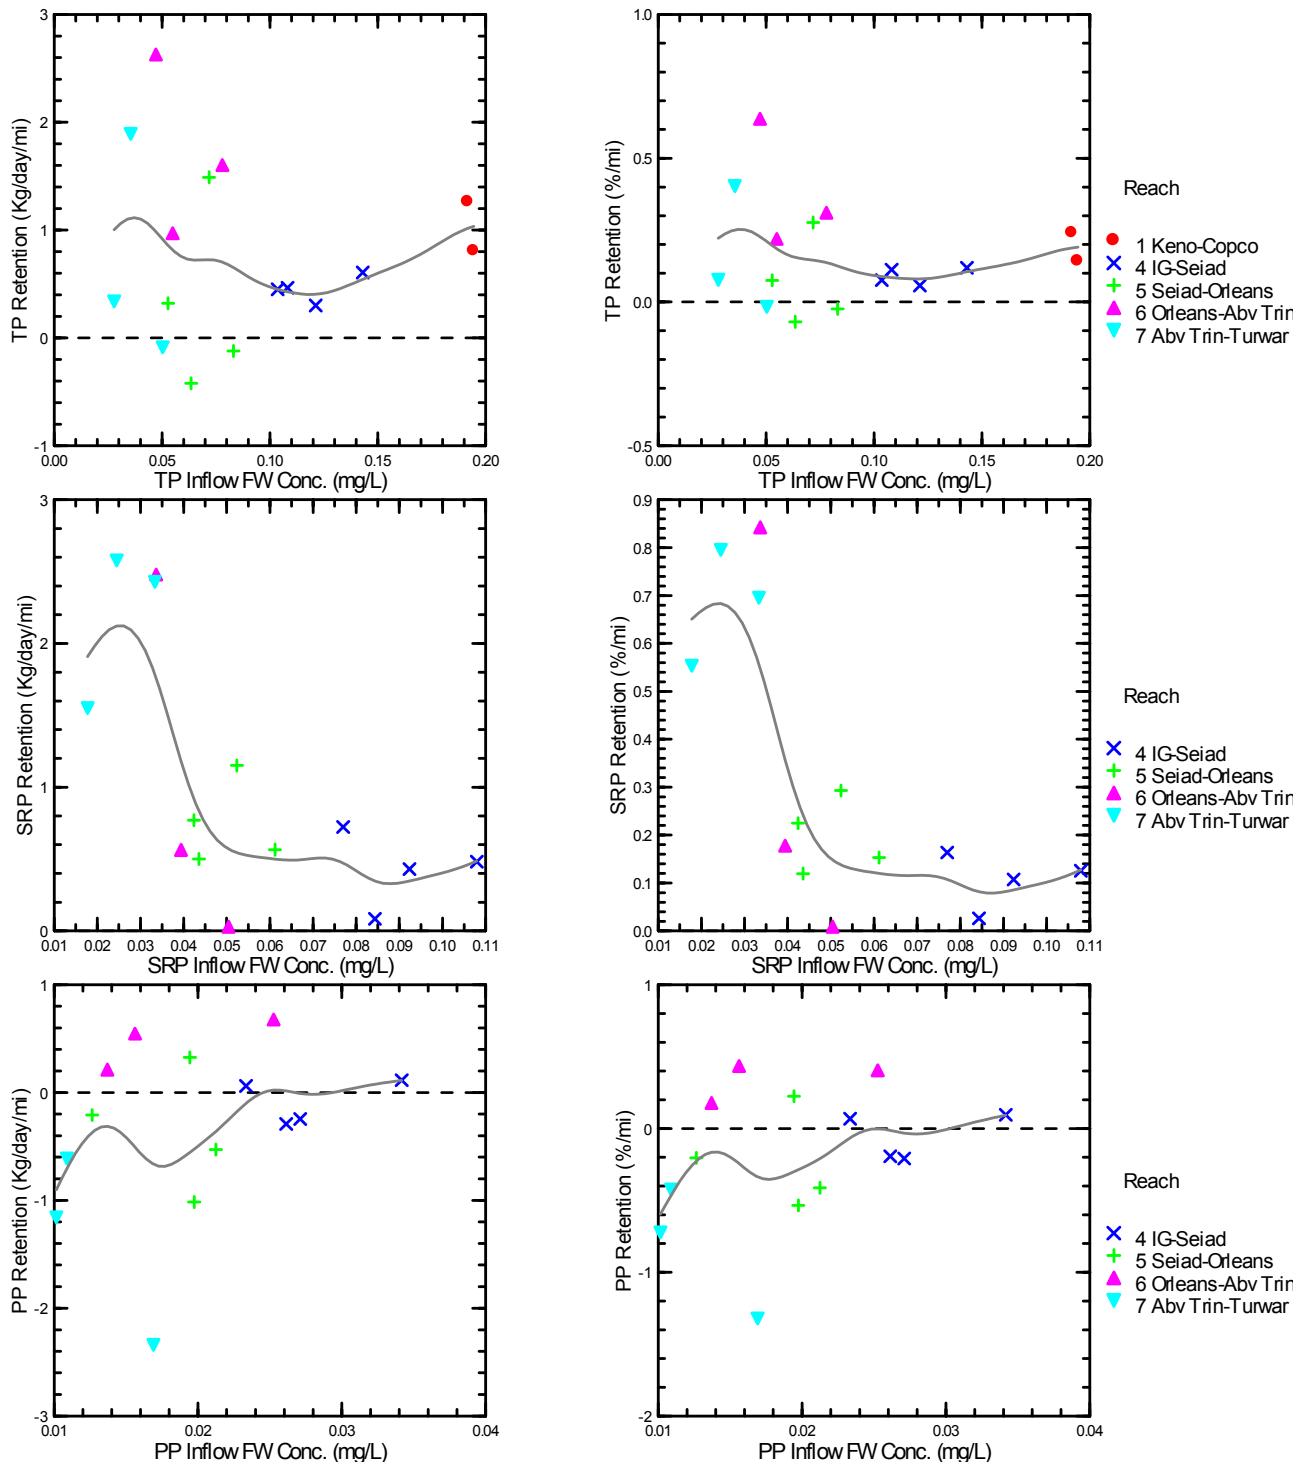

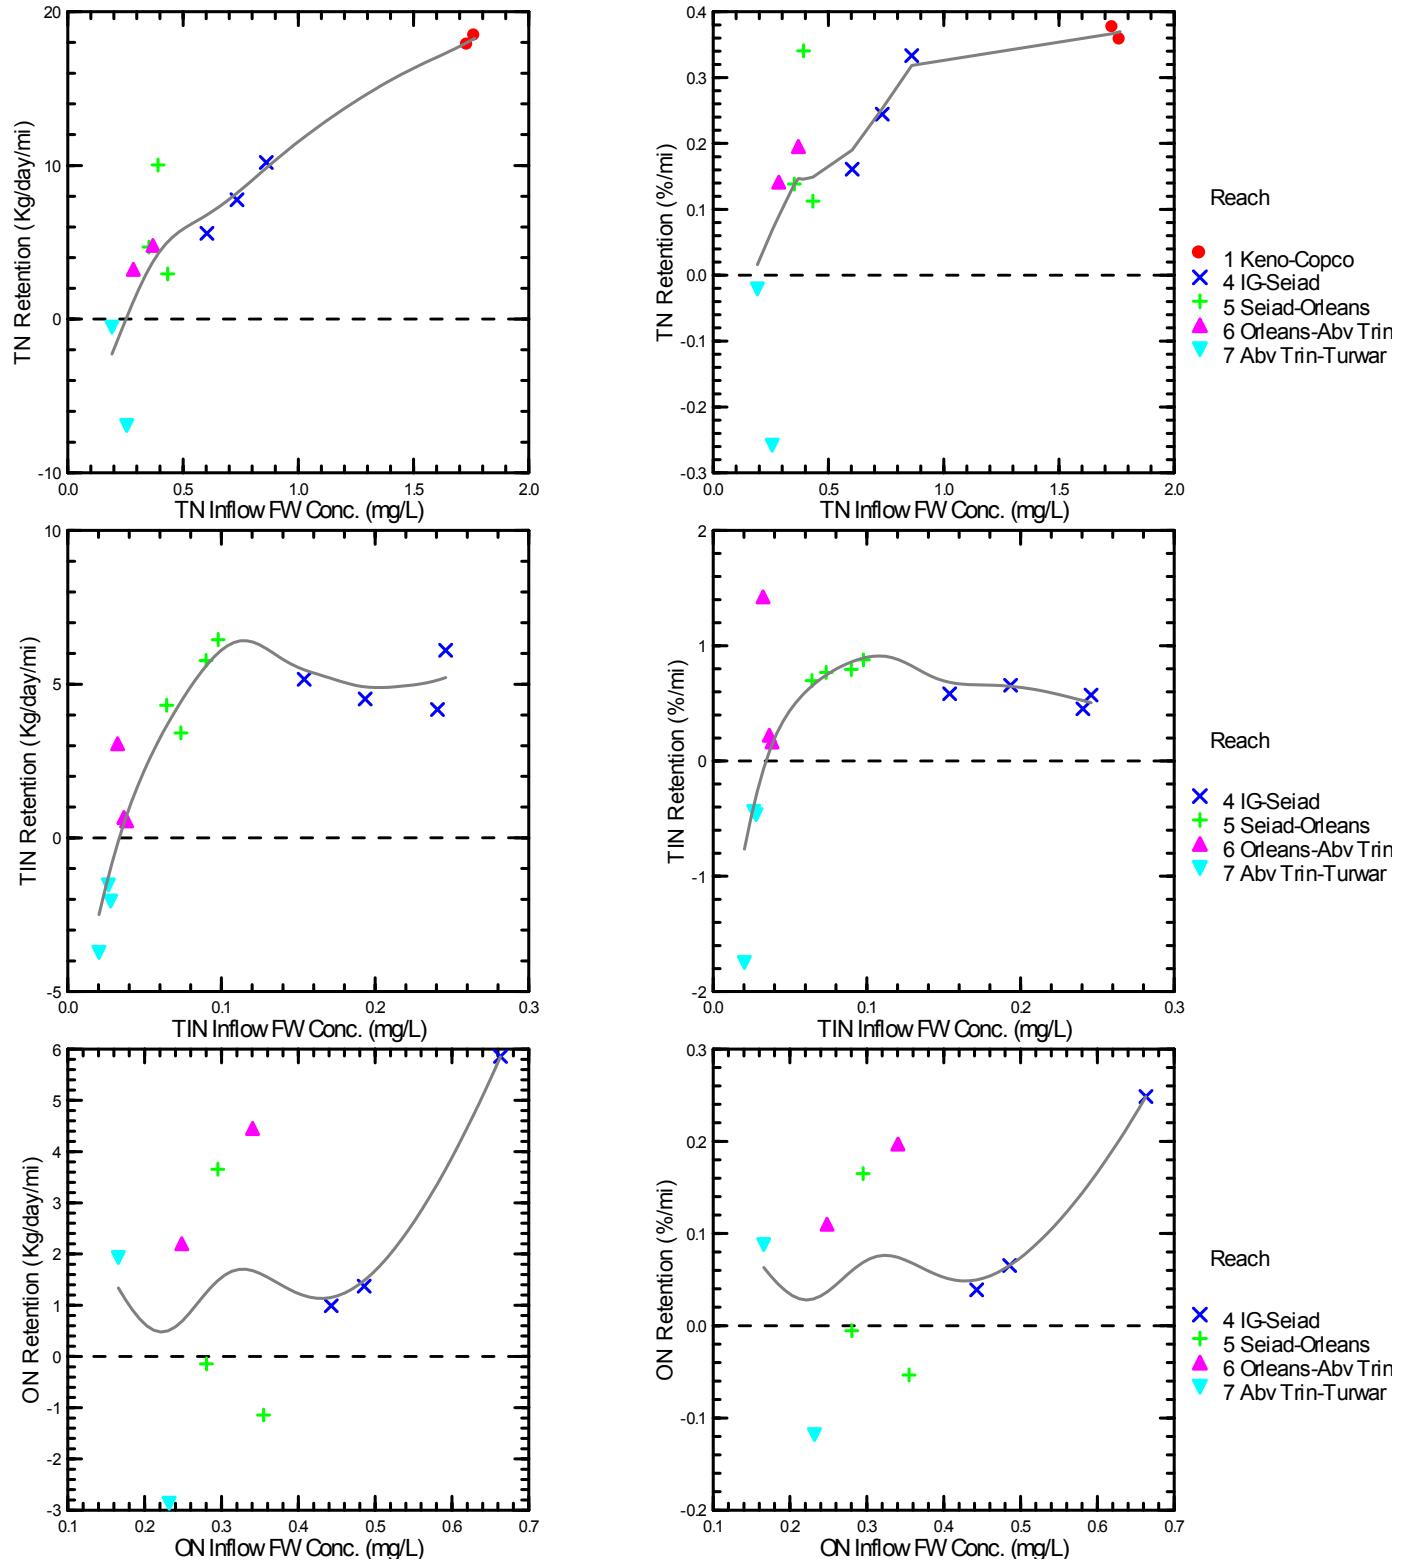

Figure A4-1. Relationship of retention to flow-weighted average inflow concentrations for phosphorus parameters in river reaches for the June-October period. Each data point is a summary of one season/site, providing a comparison between years and sites. DWLS smoother is displayed as a visual aid. See report for similar figure of July-September.

APPENDIX A5

Charts showing daily time series and summaries of outputs from multiple regression model used to predict concentrations for each station

This appendix is composed of 74 pages of multi-panel graphs, with one page one for each site and parameter used in the calculation of nutrient budgets. Ungaged tributaries are not included because their concentrations were represented by a single long-term average.

The top two time series graph on each page show the measured nutrient concentrations, daily nutrient concentrations predicted by the regression model, and daily flows. Note that the predicted concentrations shown in the top time series graph are not the final daily concentrations used in the nutrient budget, because the graphed values do not include the interpolation of the residuals (which locally stretch predicted concentrations to fit measured concentrations). The bottom time series chart shows the final loads used in the nutrient budget (including the interpolation of residuals). The predicted concentrations were constrained to 50% of minimum observed and 200% of maximum observed to avoid wild extrapolation in winter months with no samples; this does not affect mass balances for the season (June – October and July – September) periods that were actually used in the report.

The bar graphs on the middle/upper-right of the page show annual calendar year summaries of flow.

The bar graph on the lower-right corner of the page compares the results of five algorithms for the prediction of mean daily load for the combined June 1 – October 20 period of 2005–2008. Note that the results shown in the lower-right bar graph include data from every year 2005–2008, but in the report we did not use the results from parameters/sites/years with insufficient data; thus for some parameters/sites/years (i.e. Trinity River TP), the magnitude shown in the chart for the difference between the five loading algorithms is much larger than it would be if years with insufficient data were excluded (i.e. the choice of loading algorithm has much less effect on report's final results than is indicated in these bar graphs for some parameters).

The bottom-left corner of the page shows summary information for the entire June 2005 – October 2008 period including the number of samples, relative standard error, and coefficient of determination (R^2).

SRP

Dates: 05/01/2005 - 10/15/2008

*Note: the yearly results are inaccurate due to lack of samples in winter high-flow periods.**Daily concentrations predicted for winter months are inaccurate but do not impact the formulation of June-Oct nutrient balances.*

Daily Time Series:

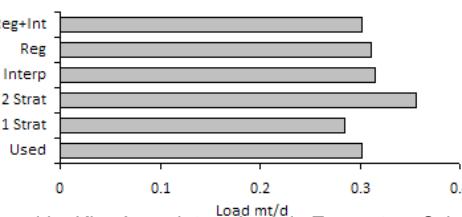

Yearly Time Series:

Site: Scott_R
 Output Period 05/01/05 10/15/08
 Calibration Period 05/01/05 10/15/08
 Sample Dates 06/01/05 10/14/08
 Samples 34
 Method: 5 - Regression + Interpolation

Variable: SRP
 Mean Daily Flow 1.964 10⁶ m³/day
 Mean Daily Load 0.01 mt/day
 Flow-Wtd Conc 0.003 ppm
 Relative Std Error 10.1%
 Regression R2 61%
 Regression SE 0.60

Mean Load vs. Method: June 1 - Oct 20
